Introduction

NOAA Ocean Exploration is the only federal program dedicated to exploring the deep ocean, closing prominent gaps in our basic understanding of U.S. deep waters and the seafloor and delivering the ocean information needed to strengthen the economy, health, and security of our nation.

Using the latest tools and technology, NOAA Ocean Exploration explores previously unknown areas of our deep ocean, making discoveries of scientific, economic, and cultural value. Through live video streams, online coverage, training opportunities, and real-time events, NOAA Ocean Exploration allows scientists, resource managers, students, members of the general public, and others to actively experience ocean exploration, expanding available expertise, cultivating the next generation of ocean explorers, and engaging the public in exploration activities. To better understand our ocean, we make exploration data available to the public. This allows us, collectively, to more effectively maintain ocean health, sustainably manage our marine resources, accelerate our national economy, and build a better appreciation of the value and importance of the ocean in our everyday lives.

This document provides all the information for the NOAA Ocean Exploration 2021 calibration of the Simrad EK60/80 echosounders on NOAA Ship *Okeanos Explorer* during EX-21-01. The calibration occurred on April 26, 2021 off of Key West, FL and May 1, 2021 off of the Florida Atlantic coast. During this procedure, the general purpose transceiver (GPT) frequencies - 18, 120, and 200 kilohertz (kHz) - were calibrated at the pulse length of 1.024 milliseconds (ms) and maximum power for each frequency. The 18 kHz was calibrated at the additional pulse lengths of 8.192 and 4.096 ms. The 38 and 70 kHz wideband transceivers (WBT) were also calibrated at both the continuous wave (CW) and frequency modulated (FM) modes. The CW modes for both frequencies were calibrated at 1.024 and 2.048 ms. The FM modes for the 38 and 70 kHz were calibrated at 1.024 and 4.096 ms, and 1.024 and 2.048 ms pulse lengths, respectively.

Location and Conditions

- The ship was located west of Key West, FL at coordinates 24.1720°, -82.5008° for April 26, 2021 and in the Atlantic Ocean at 28.4643°, -78.3049° for May 1, 2021 calibrations.
- The vessel was drifting in waters deeper than 500 meters.
- A CastAway conductivity, temperature, depth (CTD) cast was performed before commencing calibration to obtain the required water properties necessary for calibration, including the temperature and salinity at the depth of the sphere.

- Average speed of sound at the calibration depth (12 meters) for the 38, 70, 120, and 200 kHz transducers was 1537.81 meters per second. At 12 meters the average temperature was 25.8 °C and average salinity was 36 psu (practical salinity unit).
- Average speed of sound at the calibration depth (31 meters) for the 18 kHz transducer was 1535.56 meters per second. At 31 meters the average temperature was 24.5 °C and average salinity was 37 psu.

Calibration Parameters

- All frequencies were calibrated with a pulse length of 1.024 ms. The 18 kHz was calibrated at the additional pulse lengths of 8.192 and 4.096 ms. The 38 kHz and 70 kHz CW modes were calibrated at 1.024 and 2.048 ms. The FM modes for the 38 kHz and 70 kHz were calibrated at 1.024 and 4.096 ms, and 1.024 and 2.048 ms pulse lengths, respectively.
- Ping rate was 1 ping/second.
- Power was set to maximum for each frequency.
- See **Tables 1 and 2** of this document for a complete list of parameters used during calibration.

Table 1. List of relevant parameters and initial settings used during the 2021 calibration of the EK60 General Purpose Transceivers (GPTs). For more information, see Appendix A containing the channel tab for each frequency calibrated.

Frequency (kHz)	18	18	18	120	200

Calibration Procedure

To minimize the time and setup required, one sphere (38.1 mm tungsten carbide with a 6% cobalt binder) was used to calibrate all frequencies except for the 18 kHz which used a 64 mm copper sphere. The pod below refers to the transducers (38, 70, 120 and 200 kHz) that are near each other on the hull of the ship. The pod is more forward and starboard of the 18 kHz transducer so separate techniques are used to calibrate the pod versus the 18 kHz. Reference Appendix G for the X, Y, and Z hull locations for each of the transducers.

Calibrations were performed using Simrad's EK80 calibration software (version 2.0.0.0) and custom software from the NOAA Northeast Fisheries Science Center (NEFSC) to electronically control the downriggers. For the setup of the downriggers, consult the NOAA Ocean Exploration Standard Operating Procedure: EK60/EK80 Calibration¹. For the pod setup calibration, the sphere was suspended about 5 meters (16 feet) below the swivels and a five pound lead fishing weight was suspended about 3 meters (10 feet) below the sphere for stability. For the 18 kHz calibration, the sphere was suspended about 10 meters (33 feet) below the swivels and a five pound lead fishing weight was suspended about 15 meters (50 feet) below the sphere for stability.

The three calibration lines were joined using typical calibration procedures (lowering a rope under the bow with the port side calibration line attached to the end of it and retrieving the rope from the starboard side once passed under the keel). For the 18 kHz calibration, the reciprocal was used with the line being attached to the starboard side and pulling up on the port side. Prior to deployment, the sphere was soaked in a soapy water solution to break surface tension. The sphere was then lowered to a depth of approximately 15 m and 35 m from the surface of the water for the pod and 18 kHz calibration, respectively (range of about 10 m and 30 m from the transducers). This depth was achieved by having 55 feet of line out of each downrigger for the pod. For the 18 kHz calibration, the line out count was about 100 feet at the water line for each downrigger.

The target strength (TS) of the sphere used for calibration was calculated based on the CastAway CTD measurements of salinity, temperature, and depth of the sphere. See **Table 3** for the TS values of the sphere for each frequency and consult the Location and Conditions section for the CTD values. For each frequency, the sphere was initially positioned in the center of the transducer beam (on-axis) and data were recorded for several minutes. The sphere was moved throughout the beam to achieve adequate coverage (greater than 70% coverage in the center and overall - see Appendix B).

¹ Request from oar.oer.exmappingteam@noaa.gov

Table 3. Target strength (TS; units=dB) values of the spheres used during calibration based on the values calculated in the Simrad EK80 calibration software from the CTD provided temperature and salinity.

Frequency (kHz)	64 mm diameter copper sphere TS (dB)	38.1 mm diameter tungsten carbide sphere TS (dB)
18	-34.29	N/A
38 (CW)	N/A	-42.33
38 (FM)	N/A	See XML file
70 (CW)	N/A	-41.67
70 (FM)	N/A	See XML file
120	N/A	-40.05
200	N/A	-38.86

Calibration Results

There was very good coverage for all frequencies with over 300 sphere detections in each beam and root mean square (RMS) error values below the recommended 0.4 threshold (per manufacturer recommendations). See Appendix C (and XML files) for the total number of sphere detections in the beam for each frequency calibrated. See Appendix E (and XML files) for beam coverage and error values of each of the calibrated frequencies. All .raw and .xml files were saved and recorded and the updated calibration settings were applied to each transducer. See Appendix F for a complete list of the .raw and .xml files recorded during calibration.

The calibration results were comparable to the past two calibrations on NOAA Ship *Okeanos Explorer*. Aside from the new 38 kHz transducer, all other values did not deviate significantly from 2018 to present (**Table 4**). The 38 kHz transducer and topside unit (WBT) was upgraded and replaced during dry dock prior to the calibration in 2021, leading to successful acceptance and calibration of this transducer/transceiver. Note that the 18 kHz calibration occurred in a different location than past calibrations and that the 8.192 pulse length was calibrated for the first time in 2021.

Table 4. 2018-2021 calibration results. From 2018-2019, the 38 kHz system was not successfully calibrated due to a potentially damaged transducer. This transducer and the topside unit (WBT) was replaced in 2021 leading to successful calibrations. See Appendix D for the screenshots detailing the results from the 2021 calibration.
