ROV Dive Summary (from processed ROV data)	Dive Summary: EX1703_DIVE10		
	In Water:	2017-03-17T19:05:02.914000 00°, 50.134' N ; 176°, 37.614' W	
	Out Water:	2017-03-18T02:29:02.976000 00°, 49.909' N ; 176°, 37.567' W	
	Off Bottom:	2017-03-18T02:04:17.034000 00°, 49.888' N ; 176°, 37.623' W	
	On Bottom:	2017-03-17T19:55:39.023000 00°, 50.095' N ; 176°, 37.525' W	
	Dive duration:	ation: 7:24:0	
	Bottom Time: 6:8:38		
	Max. depth: 587.7 m

	The goal of this dive is to acquire baseline information on deep sea		
	, ,	0,,	cal communities on Howland
			the Pacific Remote Islands
			a environments around
	Howland & Baker Islands are virtually unexplored leading to poor knowledge of biological resources protected by these reserves. This		
	dive will target shallower depths (<600m) of Howland Island to		
Purpose of the Dive	examine deep-sea coral, sponge, and fish communities and contrast		
	those observations to a similar dive profile at Baker Is.		
	Understanding deep-sea coral habitat distribution as well as fish		
	communities is of great importance to inform management in the		
	area. This feature has been dated to 70-74MY old (*see Kopp		
	al 2007 Geochem. (Geophys. Geosyst.)	
	EX1703 dive 10 trav	versed the north slo	ope of Howland Island. This
	was our 4 th dive within the Pacific Remote Islands Marine National		
	Monument. This dive traversed a depth range of 357-587 m in order		
	to improve understanding of commercially important fish, as well as		
	protected species, within the region. During descent, we noted		
Description of the Dive	several swimmers (small fish and crustaceans) in the water column,		
	as well as high concentrations of particulate organic matter. We also noted a number of medusa (cf. Narcomedusae: <i>Aegina</i>), pyrosomes,		
	and siphonophores.		
	The dive track started at the base of a relatively steep slope,		
	progressed upslope to about 415 m, then followed the depth		

contour for a few hundred meters, then ascended to the 340m contour and traversed along that contour until the end of the dive. We observed a very high diversity of fishes, with approximately 38 taxa recorded. Specific fishes included midwater fishes (myctophids), and demersal species: goosefish (Lophiomus or Lophiodes spp.), sea toads (Chaunax spp.), codlings (Moridae: Physiculus sp.s), oreo fish (Oreosomatidae: Neocyttus cf. acanthorhynchus), scorpionfish (Bembridae: Bembradium sp., Pontinus sp.), rattails (Macrouridae: Nezumia sp., Coelorinchus spp.), tonguefish (Cynoglossidae: Symphurus spp.), congers (Congeridae: *Gnathophis*, Myrocongridae: *Myroconger* sp.), pearlfish (Carapidae: Tetragondacnus spilotus), dragonet (Callionymidae: Synchiropus sp.), roughy (Hoplostethus cf. crassispinus), sharks (Echinorhinus cookei and Carcharhinus sp.), greeneyes (Chlorophthalmidae: Chlorophthalmus sp.), deep-sea cardinal fish (Epigonidae: cf. Epigonus atherinoides), green-spotted duck billed fish (Chrionema chryseres), snake eels (Ophichthidae: Ophichthus), cusk eels (Ophediidae: Neobythites sp.), spikefish (Triacanthodidae: cf. Paratriacanthodes and unknown), armored sea robin (Triglidae: Satyrichthys or Scalicus sp.), grappos (Callanthiidae: Grammatonotus sp.), amberjack (Seriola sp.), dory (Zeniontidae: Cyttomimus sp.), boar fish (Antigonia), and "ocean bass" (Synagrops). The two pearlfish observed are representatives from a recently described genus and represent range extensions; they were previously only reported near Indonesia. A few fish species were observed with ectoparasitic gnathiid isopods attached. And now for something completely different. During the transit upslope, the rock face resembled features on Baker Island, with heavily eroded karstic terrain, interspersed with sedimented channels. Large patches of sediment were composed of small carbonate rocks with coral and shell fragments. Several different corals were observed clinging to vertical and near vertical rock ledges, including the precious coral, Coralliidae: cf. Pleurocorallium, Corallium, Hemicorallium, scleractinians (white and yellow *Enallopsammia*, a few cup coral species), plexaurids (*Paracis* sp. and cf. Swiftia), bamboos (branching and whip), primnoids (cf. Calyptrophora, collected, Callogorgia cf. formosa), acanthogorgiid, black corals (cf. Stichopathes, Bathypathes, Parantipathes?, Hexapathes?, and unknown black coral with long, extended branches), and colonial hydroid (Solanderia?). Dense colonies of Stichopathes and Callogorgia were observed on gently sloping

sedimented terrain. We also noticed several tubes, both large and small in size, on the sedimented slope, that lacked an obvious inhabitant.

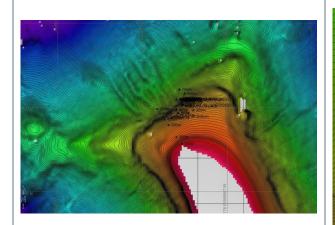

Coral associates observed included some of the largest ophiuroids (asteroschematids), chirostylids, shrimps, solitary hydroid, and amphipods. Along the rock walls, on the sediment surface, and within burrows, we observed several different kinds of squat lobsters, Galatheidae, shrimp (Heterocarpus), sea urchins (Benthopectinidae: Caenopedina cf. pulchella), several sponges (demosponges-collected one), a large hermit crab with anemone house, homolid crab without biological camouflage, a shy octopus hiding out in the sediment, and a portunid crab swimming and moving along the sediment. Underneath eroded carbonate overhangs, we saw limid bivalves. In one of the rock ledges, we observed the proboscis of spoonworm, Echiura, moving around in the water column, possibly suspension feeding. Seastars encountered on the dive included *Tarsastrocles verrilli*, cookie stars (cf. Goniasteridae: Plinthaster), coral predator (Goniasteridae: Circeaster sandrae), slime star (Pterasteridae:

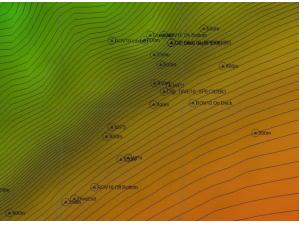

Overall Map of the ROV Dive Area
