

## Okeanos Explorer ROV Dive Summary

Dive Information		
	92°W	84°W
General Location Map	NOT	Key West, FL
General Area Descriptor	Gulf of Mexico	
Site Name	Northern West Florida Escarpment, DeSoto Canyon region	
Science Team Leads	Daniel Wagner (Biology) Adam Skarke (Geology)	
Expedition Coordinator	Nikolai Pawlenko	
ROV Dive Supervisor	Karl McLetchie	
Mapping Lead	Mike White	
ROV Dive Name		
Cruise	EX1803	
Dive Number	DIVE08	
Equipment Deploy	/ed	
ROV	Deep Discoverer	
Camera Platform	Seirios

Purpose of the Dive	West Florida Escarpment in the De Soto Canyon region. This area is currently being considered for expansion of the Flower Garden Banks National Marine Sanctuary (FGBNMS) under alternative 5. Specifically, Dive 8 sought to explore the escarpment feature at depths between 2200-2600 m for hard-bottom communities, particularly deep- sea corals, sponges, and associated fauna. There have been five previous scientific dives in this general area, all of which documented extensive and diverse deep-sea coral communities. To date, these are the deepest high-density communities known in the Gulf of Mexico. Additionally, these previous dives also documented seeps and chemosynthetic communities in the area. However, all of these previous dives were conducted over 7 km away from the Dive 8 site. Therefore, Dive 8 surveyed a previously unexplored section of the escarpment, and also sought to collect scientific information that could help evaluate the proposal for the expansion of FGBNMS.			
Description of the Dive	The ROV acquired bottom on a steep, rocky area at a depth of 2618 m at 14:58 UTC. Multiple large rocks that did not have any encrusting fauna on them, as well as an unidentified cusk-eel and a squat lobster were recorded near the landing spot. Dense aggregations of pteropod shells were seen in multiple depressions near the rocks. After reaching the seafloor, the ROV immediately sampled a carbonate rock and then proceeded upslope to the north. As the ROV climbed the escarpment wall, the seafloor was initially characterized by blocks of weathered subangular carbonate rock that ranged in size from cobble to large boulders. The rock exhibited a dark gray/brown color indicative of surface oxidation. Later, as the ROV gained elevation, the seafloor transitioned to continuous exposed carbonate rock outcrop with slopes that approached vertical. Numerous corals, sponges, and crinoids were attached to rock outcrops. At 16:05 UTC, an isolated section of thinly bedded carbonate rock was observed in contrast to massive rock bedding above and below. The ROV reached a terrace with relatively gentle slopes and a blanket of sediment cover at 17:02 UTC. In some locations the sediment exhibited bedforms indicating sufficient current velocity to mobilize fine seafloor sediment particles. As the ROV move upwards from the terrace the escarpment once			

	of thinly bedded rock observed at app reached a second terrace with sedime observed beneath a fractured tan cold dissolution of the white rock resulted pteropod shells were observed on sec The most commonly observed animal <i>Eknomisis</i> sp., and unidentified unbra <i>Stichopathes</i> sp., <i>Heteropathes</i> cf. am ( <i>Paramuricea biscaya</i> ). Other animals <i>cauliflora</i> ), chrysogorgid corals ( <i>Iridog</i> <i>Chrysogorgia</i> sp.), mushroom corals ( <i>u</i> unidentified stoloniferan octocorals, s Goniasteridae, unidentified Pteraster species and <i>Hyalonema</i> sp.), a venus- ( <i>Nematocarcinus ensifer</i> , Mysidae), st of two Argonaut mollusks. Fish observed	y bedded carbonate rock walls with a single section proximately 18:36 UTC. At 19:36 UTC the ROV ent cover. A highly friable white colored rock was ored rock crust. In some areas it appeared that in collapse of the overlying crust. Aggregations of diment and rock surfaces throughout the dive. s were bamboo corals ( <i>Jasonisis</i> sp., <i>Keratoisis</i> sp., nched Isididae), black corals ( <i>Bathypathes</i> spp., <i>hericana, Stauropathes</i> sp.), and plexaurid corals observed included bubblegum corals ( <i>Sibogagorgia</i> <i>aorgia magnispiralis, Iridogorgia splendens,</i> <i>Anthomastus</i> sp.), cup corals ( <i>Caryophyllia</i> sp.) seastars ( <i>Ceriaster</i> sp., <i>Pythonaster</i> sp., unidentified idae), hexactinellid sponges (various unidentified fly trap anemone (Hormathiidae), shrimp ralked and unstalked crinoids, and the empty shells ved during the dive included cusk-eels ( <i>Bassozetus</i> losaurs ( <i>Aldrovandia gracilis</i> and <i>Aldrovandia</i>
